Environmental science always excites me. I always want to join this course. I have a keen interest to learn more about ecology and environmental science. The environmental fact & figure always excites me to know more about it. Environmental science today covers, how living and nonliving things interact. It involves a lot of discipline and fields of study such as physics, biology, chemistry, geography, oceanography, etc. I am looking forward to joining the Environmental course. This will help me to learn about environmental science and to contribute to society.

I am an environmental lover who likes greenery, plantation, and peaceful life. One of my favorite destinations is Kerala. One should definitely visit Kerala once in his lifetime “Gods Own Country”. This place is surrounded by greenery. I always prefer to read all the environmental-related articles. Sometimes I got worried to see the current situation. People are becoming greedier for money and destroying all the recourses. The earth's heat is increasing day by day if we still ignored our environment. We will pay off by sacrificing many innocents life. The environment will give back to us, what we had offered.

Environmental Studies are to prepare the workforce of capable, passionate thinkers trained in an interdisciplinary field who are determined to solve some of the world's most complex environmental challenges.

Earth is our home, is truly a unique place providing us not only what we all need to survive but also delivers the destructive forces with great furry. History is full of these events of the creation of destruction, and man has been at the forefront of understanding this life drama since antiquity. The reason to study environmental science as then has always been the same, survival.

Thus, environmental science is very important because it studies the connection and the implication of seemingly disconnected phenomena, enlightening to the consequence of our activities such as the effect of technology on the destruction of the natural resources and the ecosystem, and what we can do to reverse some of this destructive forces and heal the environment, saving ourselves in the process.

Environmental studies, as opposed to environmental science, gives you a more complete understanding of the role of people in critical environmental issues and how they can be mobilized to help solve problems.

I am interested in joining the effort, understanding the impact of humans on the environment and resources is essential. This is the field of environmental management, otherwise known as sustainability management.
